- ✔ Fully customizable CPQ functionality
- ✔ Support for SuitePromotions
- ✔ Support for Quotes

USE CASES

- ✔ Quickly setup configurable products in NetSuite ERP
- ✔ Enable customers to easily configure products on SuiteCommerce
- ✔ Easily configure products on sales orders in NetSuite
- ✔ Warehouse can easily pick items and track inventory at line level

ABOUT

With CPQ for NetSuite, you can set up baseline products with options provided, allowing users to configure products for purchase. Set up item configurations on a sales order in NetSuite, allow customers to configure items on your SuiteCommerce or SCA site, or even enable CPQ functionality within Advanced Entity Portals!

Set up levels to define the order in which the options display. Options are non-conditional by default, but by defining dependencies you can show or hide subsequent options depending on what is selected. By combining dependencies, mandatory options, and default quantities for options, you can ensure orders with invalid option combinations cannot be placed.

Default selections can be set up to draw customer attention to specific item combinations (ex. a new color).

Options can include a price markup, and will display the cost on the option to clearly show how much it adds to the total price. You can also apply discounts using SuitePromotions set up for specific item option combinations.

This solution displays configured products as single line items in the cart view, but lists item options as separate line items on sales orders to make picking easy for warehouse workers.
