

bioprocessH2O's Automation & Controls

In-House Automation & Controls

bioprocessH2O provides and designs complete Automation engineering and control packages in-house. With this control technology, bioprocessH2O's treatment systems are fully-automated and easy to operate.

bioprocessH2O has the capability to design, build and test the electrical control systems, including the PLC function and Operation Interface Terminal (OIT), in-house before shipment to a client's site. This results in faster start-ups, minimal training, and better functionality for your wastewater treatment system.

Our Automation and Controls technology also has the ability to remote monitor via the internet. This will allow bioprocessH2O's engineering team to view the controls, provide operational support, diagnose and repair issues without traveling to your onsite location. With remote monitoring capability, bioprocessH2O provides expert and professional customer support reducing client's labor costs and eliminates costly downtime.

Automation & Controls Benefits

- Expert knowledge of the equipment and processes
- Design, build and testing of electrical control systems
- In-house QA/QC and testing before shipment
- Single point of responsibility
- Remote Monitoring
